Construction Details

Cylinders are constructed using state-of-the-art rolling and "seamless" welding technology. This insures consistent wall thickness for maximum durability and long life. More elaborate shapes are created by spinning circles of aluminum onto the forms which create the shape. Wall thickness ranges from 1.6mm to 3mm, depending on the design, the material used and the size and shape of the container. Alloys are selected to insure maximum durability in combination with the highest possible sheen of finish.

Finishes

The luster and durability of our metal finishes begins with the selection of the highest grade aluminum, is further enhanced through special polishing technology, and is completed with our durable, environmentally friendly, powder coating.

Inside Coating

The inside of each plant container is also coated with our, waterproof, chemical-resistant powder coating. The planter is then baked in a high temperature oven to ensure maximum adhesion and durability of the inside coating.

Custom Product

We make it a policy to say "Yes" to as many requests for custom product as possible. We have significant flexibility in making special sizes, matching finishes, and very often, in designing completely new products to meet customer needs. Please do not hesitate to contact us with custom product requests.
